Data Analytics

T1LM 2

v.2

**Data Collection
& Representation**

Learning Module Goals

After completing this Learning Module, you should be able to:

- Describe key data collection methods
- Know key definitions:
 - ◆ Population vs. Sample
 - ◆ Primary vs. Secondary data types
 - ◆ Qualitative vs. Quantitative data
 - ◆ Time Series vs. Cross-Sectional data
- Explain the difference between descriptive and inferential statistics
- Describe different sampling methods

Tools of Business Statistics

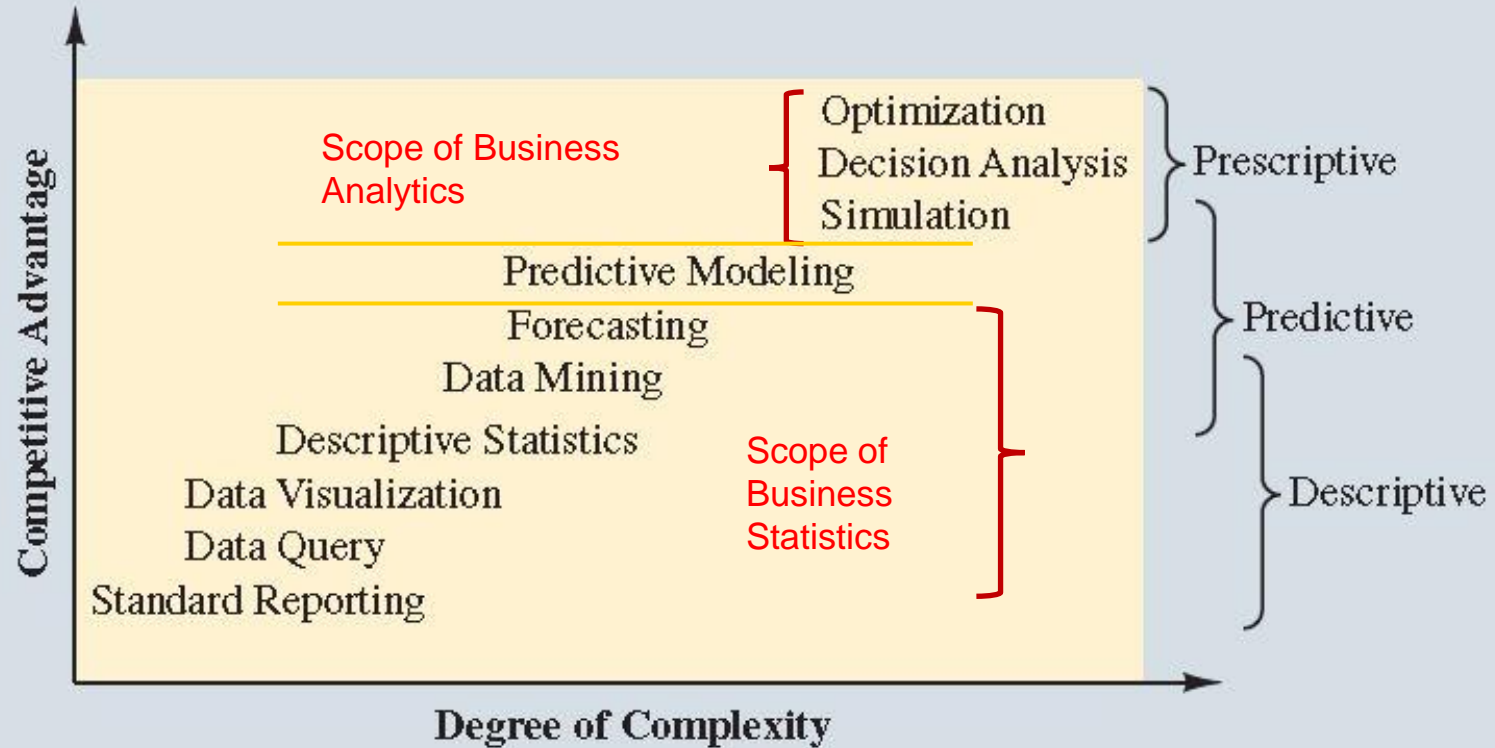

- **Descriptive statistics**

- Collecting, presenting, and describing data

- **Inferential statistics**

- Drawing conclusions and/or making decisions concerning a population based only on sample data

Tools of Business Statistics

Source: Adapted from SAS.

Market Research Process

Burke and Associates

Descriptive Statistics

- **Collect data**

- e.g. Survey, Observation, Experiments

- **Present data**

- e.g. Charts and graphs

- **Characterize data**

- e.g. Sample mean = $\frac{\sum x_i}{n}$

Data Sources

**Primary
Data Collection**

**Secondary
Data Compilation**

Observation

Survey

Experimentation

**Print or Electronic
and WEB**

Populations and Samples

- A **Population** is the set of all items or individuals of interest

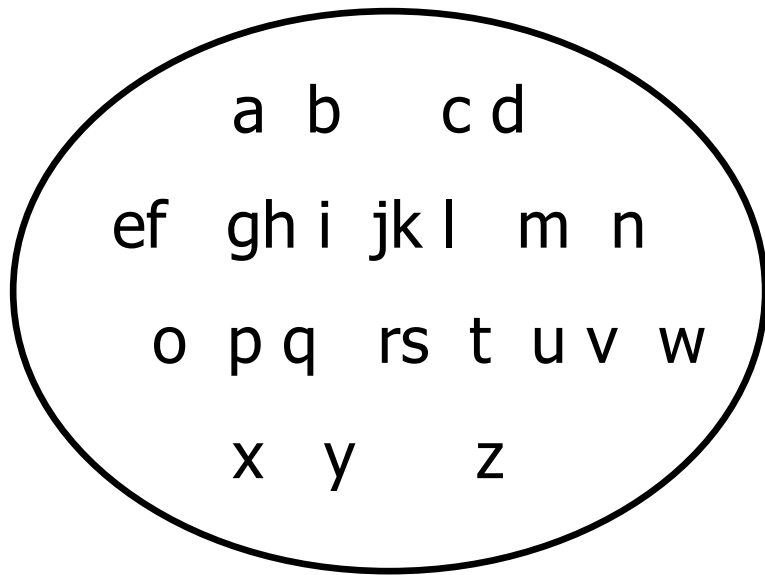

■ Examples:	All likely voters in the next election All parts produced today All sales receipts for November
--------------------	---

- A **Sample** is a subset of the population

■ Examples:	1000 voters selected at random for interview A few parts selected for destructive testing Every 100 th receipt selected for audit
--------------------	--

Population vs. Sample

Population

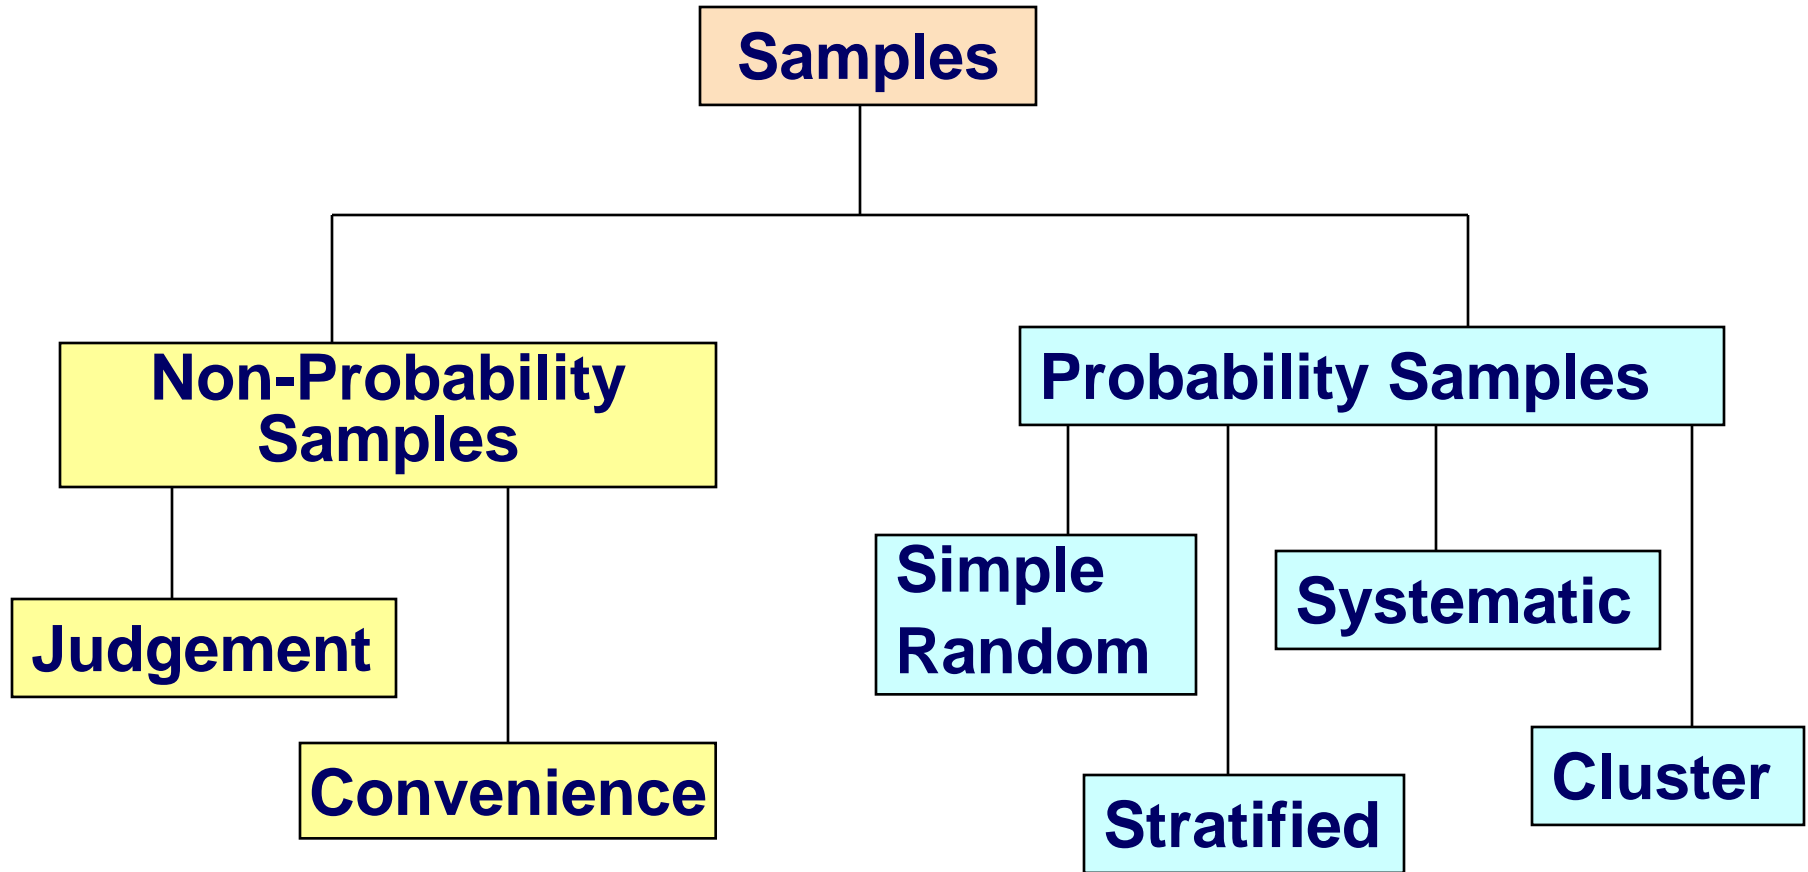

Sample

Why Sample?

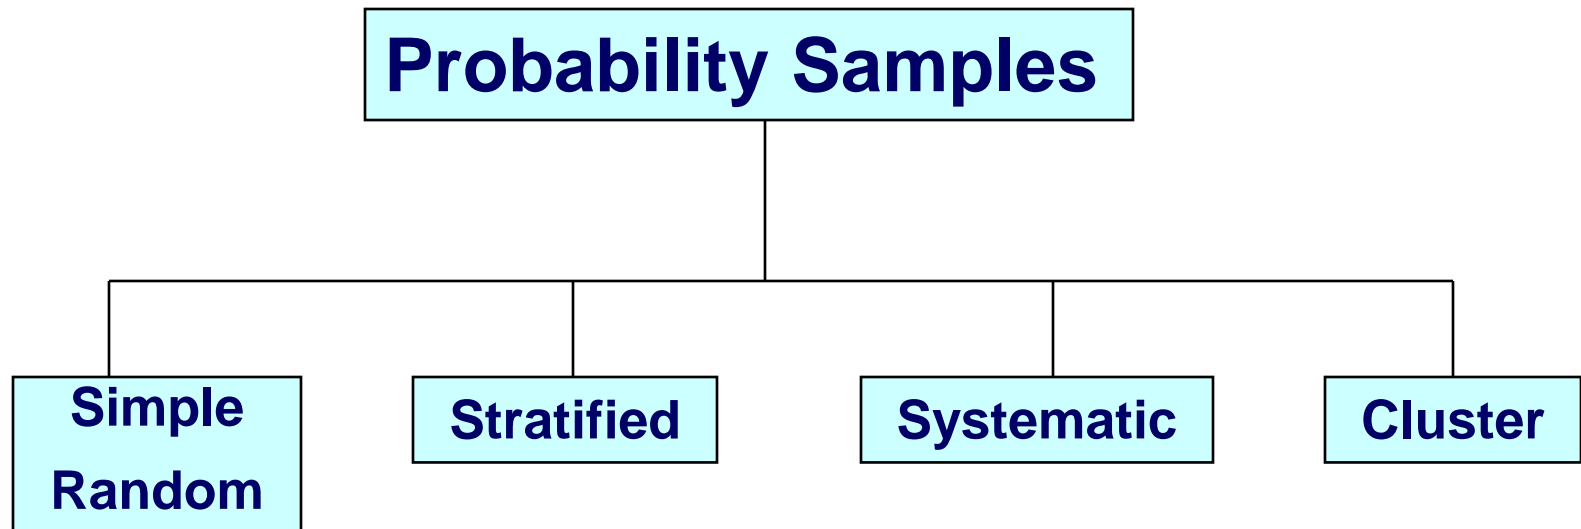

- Less time consuming than a census
- Less costly to administer than a census
- It is possible to obtain statistical results of a sufficiently high precision based on samples.

Sampling Techniques

Statistical Sampling

- Items of the sample are chosen based on known or calculable probabilities

Simple Random Samples

- Every individual or item from the population has an **equal chance** of being selected
- Selection may be with replacement or without replacement
- Samples can be obtained from a table of random numbers or computer random number generators

Stratified Samples

- Population divided into subgroups (called *strata*) according to some common characteristic
- Simple random sample selected from each subgroup
- Samples from subgroups are combined into one

Systematic Samples

- Decide on sample size: n
- Divide frame of N individuals into groups of k individuals: $k=N/n$
- Randomly select one individual from the 1st group
- Select every k^{th} individual thereafter

$N = 64$
 $n = 8$
 $k = 8$

First Group

Cluster Samples

- Population is divided into several “clusters,” each representative of the population
- A simple random sample of clusters is selected
 - All items in the selected clusters can be used, or items can be chosen from a cluster using another probability sampling technique

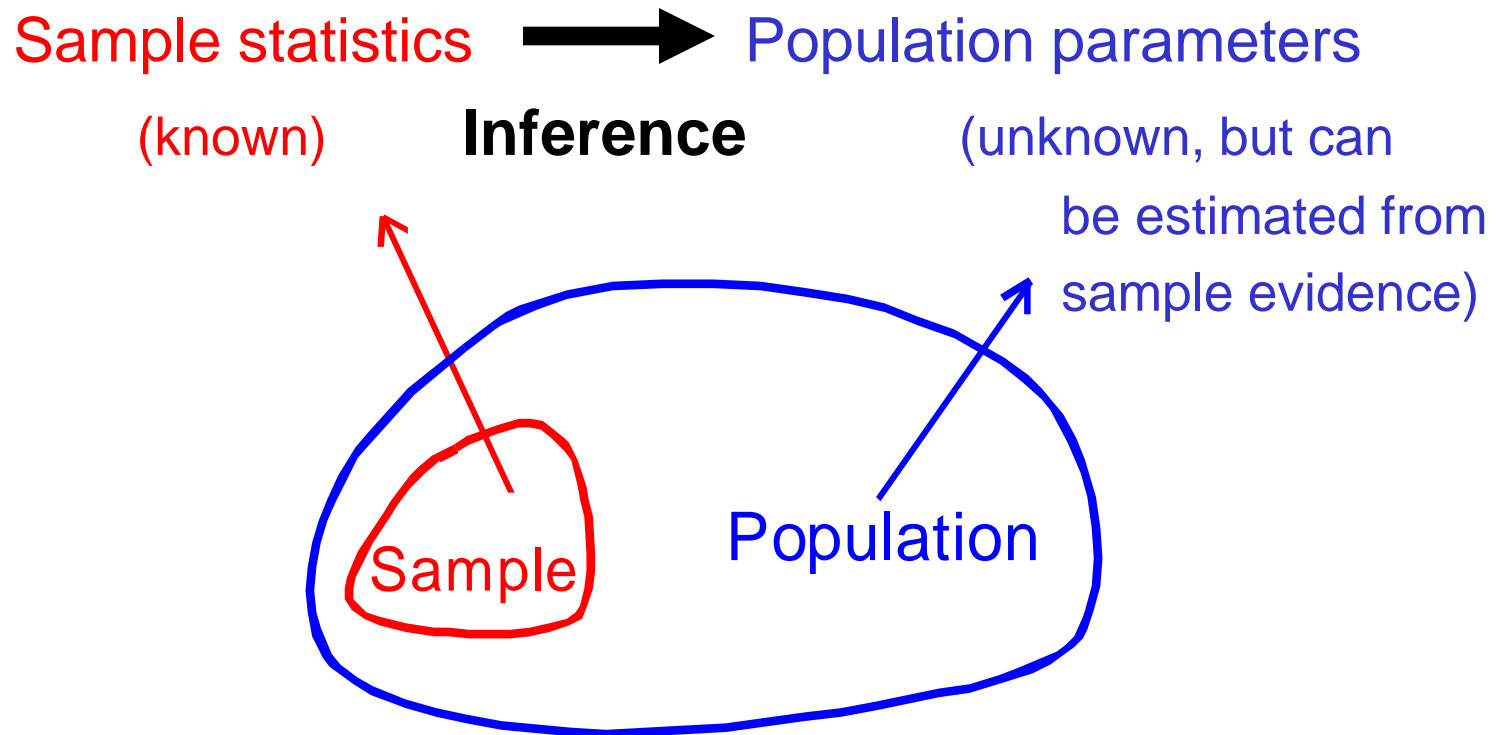

Key Definitions

- A **population** is the entire collection of things under consideration
 - A **parameter** is a summary measure computed to describe a characteristic of the population
- A **sample** is a portion of the population selected for analysis
 - A **statistic** is a summary measure computed to describe a characteristic of the sample

Inferential Statistics

- Making statements about a population by examining sample results

Inferential Statistics

Drawing conclusions and/or making decisions concerning a **population** based on **sample** results.

■ Estimation

- e.g.: Estimate the population mean weight using the sample mean weight

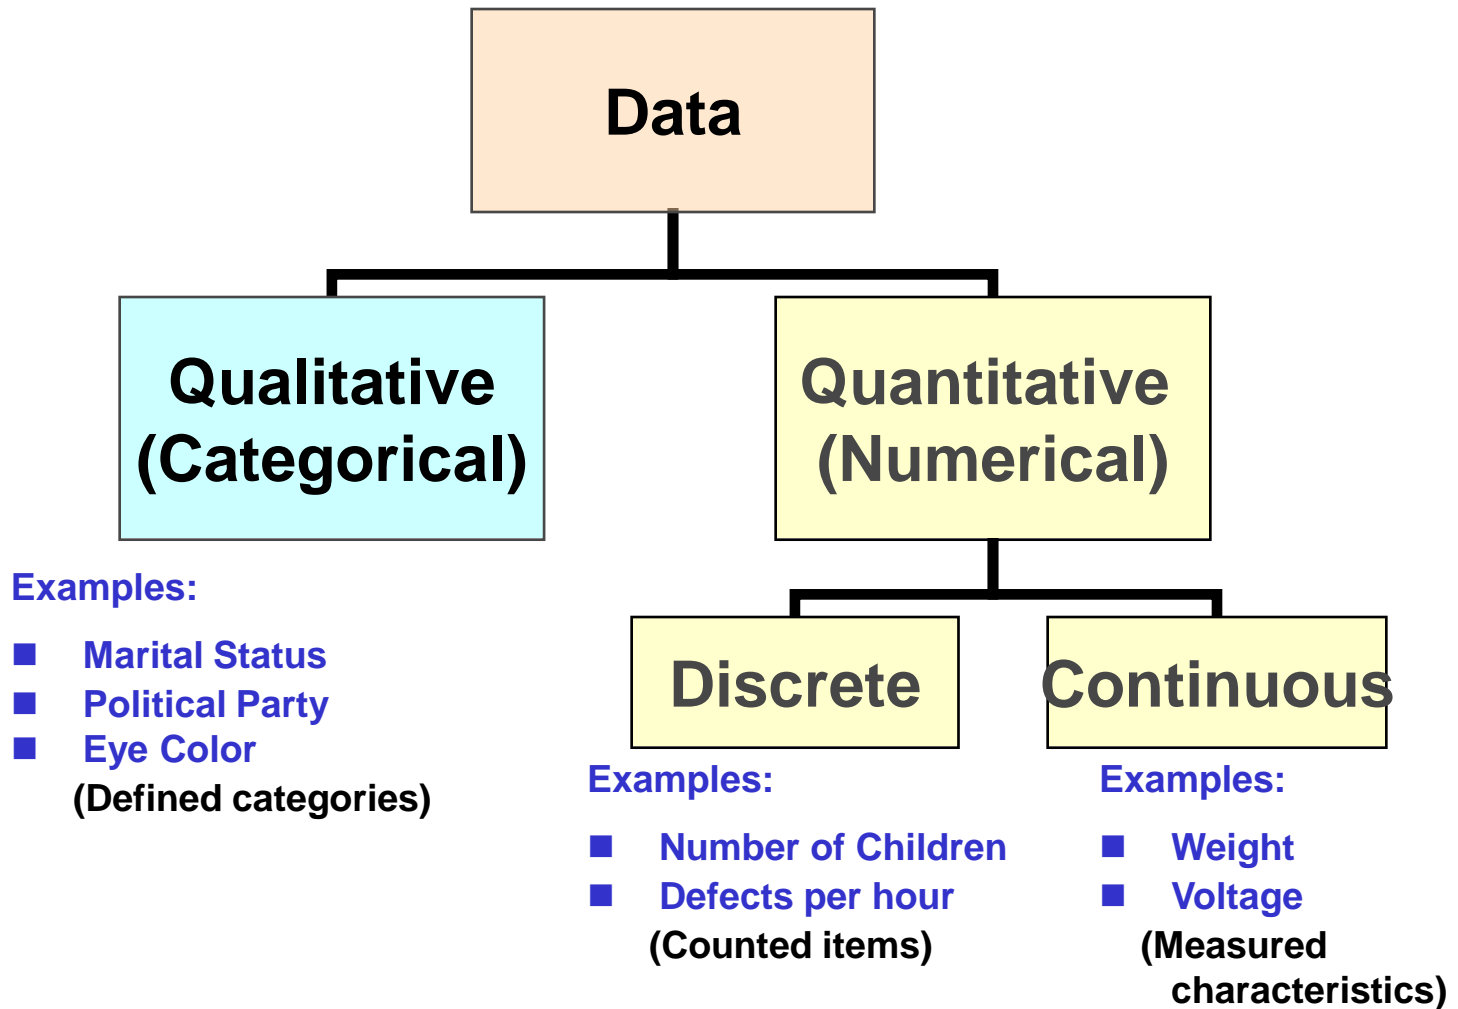

■ Hypothesis Testing

- e.g.: Use sample evidence to test the claim that the population mean weight is 120 pounds

Data Types

Data Types

- **Time Series Data**

- Ordered data values observed over time

- **Cross Section Data**

- Data values observed at a fixed point in time

Data Types

	Sales (in \$1000's)			
	2003	2004	2005	2006
Atlanta	435	460	475	490
Boston	320	345	375	395
Cleveland	405	390	410	395
Denver	260	270	285	280

**Time
Series
Data**

**Cross Section
Data**

Frequency Distributions

What is a Frequency Distribution?

- A frequency distribution is a **list or a table** ...
- containing the **values of a variable** (or a set of ranges within which the data falls) ...
- and the **corresponding frequencies** with which each value occurs (or frequencies with which data falls within each range)

Why Use Frequency Distributions?

- A frequency distribution is a way to summarize data
- The distribution condenses the raw data into a more useful form...
- and allows for a quick visual interpretation of the data

Frequency Distribution: Discrete Data

- **Discrete data:** possible values are countable

Example: An advertiser asks 200 customers how many days per week they read the daily newspaper.

Number of days read	Frequency
0	44
1	24
2	18
3	16
4	20
5	22
6	26
7	30
Total	200

Relative Frequency

Relative Frequency: What proportion is in each category?

Number of days read	Frequency	Relative Frequency
0	44	.22
1	24	.12
2	18	.09
3	16	.08
4	20	.10
5	22	.11
6	26	.13
7	30	.15
Total	200	1.00

$$\frac{44}{200} = .22$$

22% of the people in the sample report that they read the newspaper 0 days per week

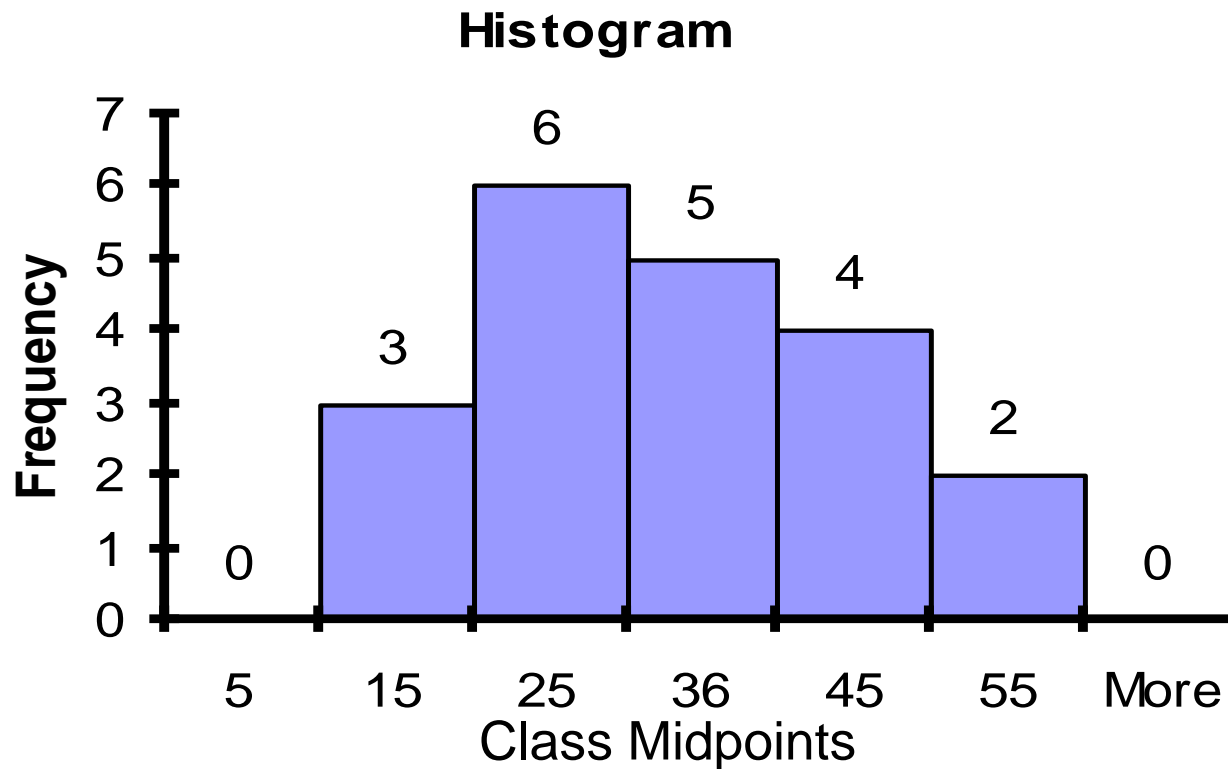

Histograms

- The **classes** or **intervals** are shown on the horizontal axis
- **frequency** is measured on the vertical axis
- Bars of the appropriate heights can be used to represent the number of observations within each class
- Such a graph is called a **histogram**

Histogram Example

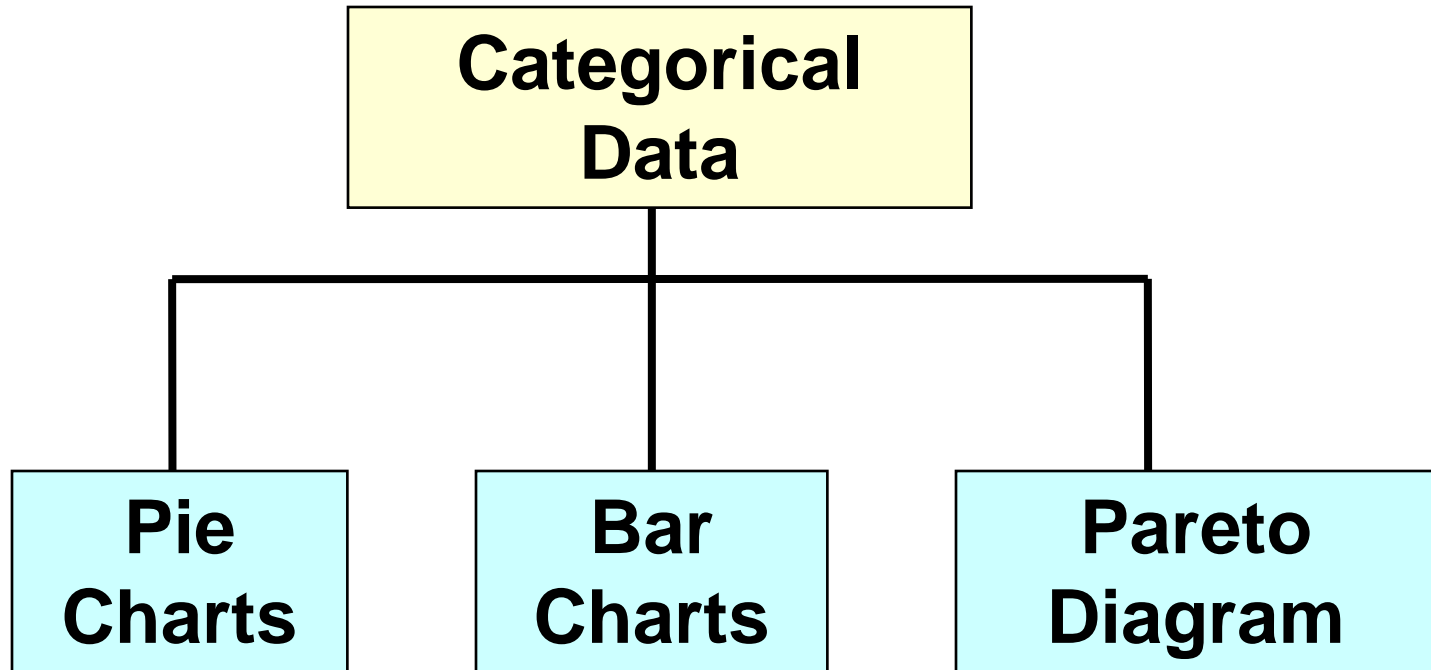

Data in ordered array:

12, 13, 17, 21, 24, 24, 26, 27, 27, 30, 32, 35, 37, 38, 41, 43, 44, 46, 53, 58

No gaps between bars, since continuous data

Graphing Categorical Data

Bar and Pie Charts

- Bar charts and Pie charts are often used for qualitative (category) data
- Height of bar or size of pie slice shows the frequency or percentage for each category

Pie Chart Example

Current Investment Portfolio

Investment Type	Amount (in thousands \$)	Percentage
Stocks	46.5	42.27
Bonds	32.0	29.09
CD	15.5	14.09
Savings	16.0	14.55
Total	110	100

(Variables are Qualitative)

Bar Chart Example

Investor's Portfolio

Pareto Diagram Example

Bar Chart Example

Number of days read	Frequency
0	44
1	24
2	18
3	16
4	20
5	22
6	26
7	30
Total	200

Tabulating and Graphing Multivariate Categorical Data

- Investment in thousands of dollars

Investment Category	Investor A	Investor B	Investor C	Total
Stocks	46.5	55	27.5	129
Bonds	32.0	44	19.0	95
CD	15.5	20	13.5	49
Savings	16.0	28	7.0	51
Total	110.0	147	67.0	324

Tabulating and Graphing Multivariate Categorical Data

(continued)

- Side by side charts

Side-by-Side Chart Example

- Sales by quarter for three sales territories:

	1st Qtr	2nd Qtr	3rd Qtr	4th Qtr
East	20.4	27.4	59	20.4
West	30.6	38.6	34.6	31.6
North	45.9	46.9	45	43.9

Line Charts and Scatter Diagrams

- **Line charts** show values of one variable vs. time
 - Time is traditionally shown on the horizontal axis
- **Scatter Diagrams** show points for bivariate data
 - one variable is measured on the vertical axis and the other variable is measured on the horizontal axis

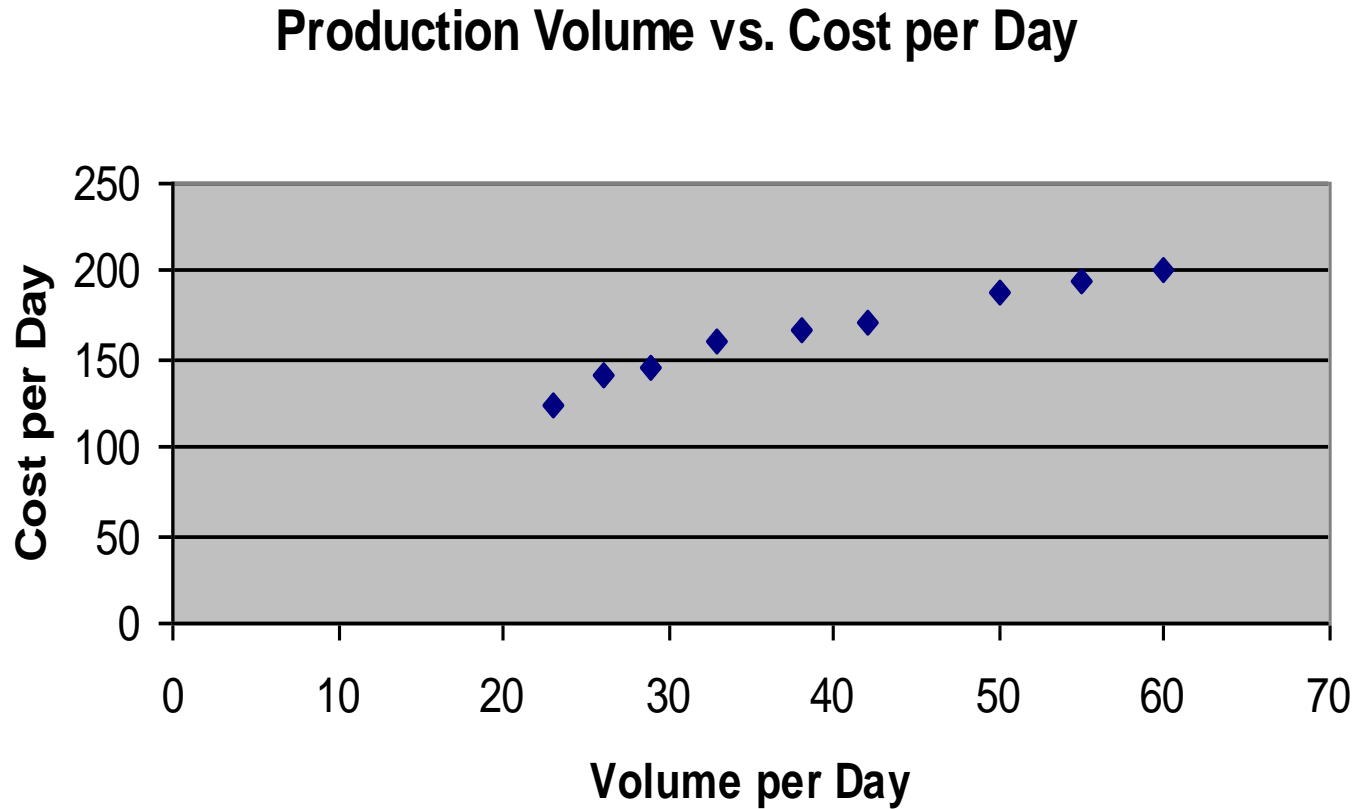

Line Chart Example

Year	Inflation Rate
1985	3.56
1986	1.86
1987	3.65
1988	4.14
1989	4.82
1990	5.40
1991	4.21
1992	3.01
1993	2.99
1994	2.56
1995	2.83
1996	2.95
1997	2.29
1998	1.56
1999	2.21
2000	3.36
2001	2.85
2002	1.58

Scatter Diagram Example

Volume per day	Cost per day
23	125
26	140
29	146
33	160
38	167
42	170
50	188
55	195
60	200

Types of Relationships

- Linear Relationships

Types of Relationships

(continued)

- Curvilinear Relationships

Types of Relationships

(continued)

- No Relationship

Learning Module Summary

- Reviewed key data collection methods
- Introduced key definitions:
 - ◆ Population vs. Sample
 - ◆ Primary vs. Secondary data types
 - ◆ Qualitative vs. Quantitative data
 - ◆ Time Series vs. Cross-Sectional data
- Examined descriptive vs. inferential statistics
- Described different sampling techniques
- Reviewed data types and measurement levels
